

SUMMARY

2.0 Fundamental of Relational Database

2.1 Introduction to Database

2.1.2 Differentiate between file processing system and database system.

	File Processing System	Database System
Description	Each department or area within an organization has its own set of files.	Many programs and users share the data in the database.
How the data is stored and manipulated	File processing systems were originally designed for single user.	Databases are designed for multiple users
Who can access the data	Allow single user or small number of users who don't need to do a lot of incredibly complicated data manipulation.	Allow multiple users to access the database at the same time by using highly complex logic and language.
How much data can be stored	Relatively smaller amount of data	Relatively larger amount of data

2.1.3 Identify advantages and disadvantages of using database system.

Advantages	Disadvantages
• Reducing Data Redundancy • Improved Data Integrity • Sharing of Data • Easier access • Reduced development time • Data Security • Privacy • Backup and Recovery • Data Consistency	• High Complexity • Database handling staff required. • More Vulnerable due to Database Failure • Huge Size • More Costly • High Hardware Cost • Upgradation Costs • Cost of Data Conversion

2.2 Basic Concept of Database

2.2.3 Explain the concept of Data Integrity

Data integrity is a form of control that ensures the consistency of data.

- ✓ Data is accurate– there are no data inconsistencies.
- ✓ Data is verifiable– the data will always yield consistent results.

2.2.4 Explain the functions of database object.

(Table, Query, Form, Report)

Database Object	Function
Table	• To arrange data in rows and columns • To define and store data
Query	• To specifies which records should be retrieved by specifying criteria. • Can specify certain fields to be displayed. • provides a custom view of data from one or more tables.
Form	• To enter or edit data through a window on the screen. • Allows viewing data, one record at a time. • For data input or display or for control of application execution.
Report	• To design a report on the screen • To display or print the data in the database. • For formatting, calculating, printing, and summarizing selected data.
